Lab 7

Do a sentiment analysis on the `syedkhalid076/Sentiment-Analysis` dataset. This dataset contains tweets (use only 10k samples for train dataset).

Sentiment Analysis Dataset
Overview
This dataset is designed for sentiment analysis tasks, providing labeled examples across three sentiment categories:
0: Negative
1: Neutral
2: Positive

```
from datasets import load_dataset
# Load the dataset
dataset = load_dataset("your-dataset-path")

# Access splits
train_data = dataset["train"]
validation_data = dataset["validation"]
test_data = dataset["test"]

# Example: Printing a sample
print(train_data[0])
```

1. Use the two approaches covered in class and compare them with the best. (classifier and use the linguistic resource)
2. Notice that the text in the dataset is very short in some cases, so the accuracy of models may be relatively low.

   Briefly discuss how you can potentially address this problem (short text).
